This Masterplan encompasses the extension of the typically modernist 1960s campus of the Eindhoven University of Technology. While the campus was originally located on the outskirts of Eindhoven, through the urban expansion of the city it is currently situated rather centrally: an ‘inner city’ campus with ‘outer city’ qualities. The developed Masterplan builds on the coherent and consistently elaborated vision of (functionalist) urban design and architecture with a primarily industrial aesthetic. The starting point of the design is the green and generously spacious character of the campus, as formulated in the original urban plan

of the campus by OD205, the office of campus architect Van Embden. This character is strengthened and restored where necessary. The quantity of pavement in the cultivated core of the existing campus is being reduced in favour of green space, and parking lots are replaced by parking buildings. With the arrival of knowledge-intensive companies, institutes, a technical college and dwellings on campus, we no longer speak of TU/e campus, but of TU/e Science Park. A science- and engineering campus, substantively built around the university, with a wide variety of functions and facilities on a modern campus near the centre of Eindhoven.
